

Amendments to the Specification

At page 3, please rewrite the last full paragraph as follows:

In part to allow a receiving station to determine the actual identity of a current talker (rather than to just distinguish the current talker from others), RFC 1889 introduces a control protocol, called the "RTP Control Protocol" (~~RTP~~ RTCP). According to RFC 1889, RTCP provides for periodically transmitting special control packets to the participants of an RTP session, separate from the RTP stream that the participants are exchanging (i.e., the RTCP control packets are not themselves RTP packets). According to the RFC, each ~~RTP~~ RTCP packet can contain several "source description" (SDES) items, which can specify a direct correlation between an SSRC and a user's actual name, e-mail address or the like.
